ABSTRACT OF THE DISCLOSURE

A schedule view is displayed in a print server. In the schedule view, print-jobs are displayed with rectangular shapes having lengths corresponding to printing time and color (or

5   pattern) corresponding to its state, and the print-jobs are arranged and displayed in the order of prints to which the print-jobs are allocated. It is possible to intuitively grasp relative magnitude of a load of each printer by the length of a job graph, and an absolute amount of the load of each

10   printer converted into a printing time by a displayed time scale. In addition to this, details of a job which is being processed, details of a selected job, and a state of each printer are also displayed.
